This post is about how to download primavera p6 version 8.3 professional torrent with the help of BitTorrent client, uTorrent. BitTorrent client is used for downloading files through P2P or peer-to-peer protocol, which significantly increases download speeds by taking advantage of the bandwidth and free storage capacity of all the node computers that are connected to it. When you use BitTorrent, your computer becomes a host computer that hosts some small part of the file being downloaded to other computers in the same network. This can significantly decrease your Internet bandwidth usage and make downloads faster. Step 1: Download uTorrent client, if you don't use it already. Step 2: Browse and search for the torrent file of your desired software and then download that file. Step 3: Use your personal username and password to login into your account on the official site of BitTorrent. Step 4: Once logged in, click on Advanced link to display Protocol Encryption window. Tick the checkbox provided which says Use protocol encryption (requires authentication) and click OK button. Now you will see a confirmation message underneath the text box saying "Protocol encryption (requires authentication) has been enabled. It is recommended to first restart the BitTorrent client to make sure everything is properly set up. Restarting will also make sure that on your computer there are no closed programs or other messes on virtual memory virtual memory address space that might somehow interfere with the installation process. Once all settings are completed, click Close button at the bottom of the window. Now launch uTorrent client, Go to Preferences tab and tick on "Start application on system startup" option, then hit OK button. After that, go to Settings tab and then click on OpenVPN option and select your desired VPN connection to be used in torrent downloads. Now when you're ready with all the settings and the torrent file of your desired software is downloaded, proceed with the installation and wait until it's completely finished. Once installation is completed, open the folder where you installed your software and double-click on Post-Installation Script icon to run it. Step 5: After running Post-Installation Script, uTorrent client automatically starts downloading all components of your software such as Crack File, Setup File, Patch Setup File and etc. Step 6: Once downloading of all components is complete, Restart your computer and then Install Post-Installation Setup file that you just downloaded from uTorrent. Step 7: After installation is completed, your software is installed and ready to use.
